

IN THE CLAIMS

Please cancel claims 2, 23, 26 and 35 without prejudice or disclaimer of subject matter. Please amend Claims 1, 3 to 5, 8, 19, 25, 27, 28, 32 to 34, 36 to 38 and 48, and add claims 57 to 59 as shown below. The claims, as pending in the subject application, read as follows:

1. (Currently Amended) A method of presenting search results obtained from a search conducted over a computer network, the search being performed using searching criteria and returning information including a network location corresponding to each search result, said method comprising the steps of:
 - (a) interpreting one of the search results including the corresponding network location;
 - (b) extracting data associated with the corresponding network location;
 - (c) examining the extracted data to identify therein the searching criteria to provide at least one specific location ~~of the searching criteria~~ within the extracted data of the searching criteria;
 - (d) using the one specific location to identify a portion of ~~from~~ the extracted data ~~specific data~~ including at least ~~content corresponding to~~ the searching criteria ~~at the one specific location and a context of the specific data~~;
 - (e) formatting the portion ~~specific data~~ including the ~~content~~ ~~corresponding to the searching criteria and the context~~ into a printable document, to present the portion in the same manner as if presented within the entirety of the extracted data; and

(f) repeating steps (a) to (e) for each remaining search result in which step (e) incorporates the corresponding formatted portion ~~specific data~~ into the printable document.

2. (Cancelled)

3. (Currently Amended) A method according to claim 1, wherein step (e) comprises incorporating graphical separators into the formatted printable document to separate the portions of extracted data from different ones of the network locations.

4. (Currently Amended) A method according to claim 1, wherein step (e) further comprises formatting root data, obtained from the extracted data at a root location of the corresponding network location, into the formatted printable document in association with the corresponding portion ~~the specific data~~ whereby the root data supports the context of the corresponding portion ~~specific data~~.

5. (Currently Amended) A method according to claim 4, wherein step (e) further comprises incorporating graphical separators into the formatted printable document to separate the corresponding portion ~~specific data~~ from the root data of the corresponding network location.

6. (Previously Presented) A method according to claim 1, wherein the printable document is formatted into a plurality of columns.

7. (Previously Presented) A method according to claim 1, comprising the further step of:

(g) electronically displaying the printable document to an instigator of the search.

8. (Currently Amended) A method according to claim 1, wherein the portion ~~content and context of the specific data~~ is formatted into the printable document in a print preview format.

9. (Previously Presented) A method according to claim 1, comprising the further step of:

(h) printing the printable document.

10. (Previously Presented) A method according to claim 7, comprising the further step of:

(h) printing the electronically displayed printable document.

11. (Previously Presented) A method according to claim 1, wherein the extracted data is of a plurality of data types, and the formatting converts the data types into a common data type suitable for each of electronic display and printing.

12. to 18. (Canceled)

19. (Currently Amended) A method of formatting an electronic document intended for reproduction by printing, said method comprising the steps of:

- (a) obtaining, from a searching process, location information within a computer network of at least one search result returned by the searching process;
- (b) using the location information to fetch and store document data from the computer network relating to each search result, the document data including at least a portion incorporating the content and a reproducible context of searching criteria used to instigate the searching process; and
- (c) formatting the ~~stored~~ document data including at least the portion ~~the content and the reproducible context corresponding to the searching criteria~~ into a printable electronic document to thereby reproduce the portion in the printable electronic document in the same manner as if presented within the entirety of the extracted data ~~content including the searching criteria and the context in which the searching criteria is found in the computer network.~~

20. (Previously Presented) A method according to claim 19, wherein step (b) comprises, for each search result, the sub-steps of:

- (ba) using the corresponding location information to fetch and store all document data accessible for the search result;
- (bb) checking the stored document data to identify the searching criteria therein; and
- (bc) recording, for each identification of the searching criteria, a specific location of the searching criteria within the stored document data.

21. (Previously Presented) A method according to claim 20, wherein step (b) comprises, for each search result, the further sequential step of:

(bd) discarding the stored document data for the search result where the searching criteria is not at least once identified therein in a reproducible context.

22. (Previously Presented) A method according to claim 19, wherein step (c) comprises, for each search result, the sub-steps of:

(ca) identifying at least one portion of the stored document data associated with at least one reproducible occurrence of the search criteria;

(cb) converting the identified one portion to a data format suitable for both electronic display and printing; and

(cc) incorporating the converted identified one portion into the electronic document according to a predetermined format to thereby reproduce the content and context of the searching criteria.

23. (Cancelled)

24. (Previously Presented) A method according to claim 22, wherein step (c) comprises, for each search result, the further sub-steps of:

(cd) identifying an initial portion of the stored document data arranged at a root of the location information; and

(ce) converting the initial portion to the predetermined format;

wherein step (cc) comprises incorporating the converted initial portion and the converted identified one portion into the electronic document.

25. (Currently Amended) Apparatus for presenting search results obtained from a search conducted over a computer network, said search being performed using searching criteria and returning information including a plurality of network locations, said apparatus comprising:

means for storing document data associated with and including at least one of said network locations;

means for extracting stored document data associated with one of said network locations;

means for examining said extracted data to identify therein said searching criteria to provide at least one specific location within said extracted data of said searching criteria;

means for using said one specific location to identify a portion of the ~~from~~ ~~said~~ extracted data ~~specific data~~ including at least said searching criteria in a reproducible context with other data from the corresponding network location; and

means for formatting said portion ~~specific data~~ including the searching criteria and the reproducible context into a printable document, to present the portion in the same manner as if presented within the entirety of the extracted data.

26. (Cancelled)

27. (Currently Amended) Apparatus according to claim 25, wherein said means for formatting incorporates graphical separators into said formatted printable document to separate the portions of extracted data from corresponding different ones of said network locations, whereby portion ~~content and context of said specific data~~ is formatted into the printable document in a print preview format.

28. (Currently Amended) Apparatus according to claim 25, wherein said means for formatting further formats root data, obtained from said extracted data at a root location of the corresponding network location, into said formatted printable document in association with the corresponding portion ~~specific data~~ whereby said root data supports the context of said corresponding portion ~~specific data~~ and incorporates graphical separators into said formatted printable document to separate said corresponding portion ~~specific data~~ from said root data of said corresponding network location.

29. (Original) Apparatus according to claim 25, wherein said printable document is formatted into a plurality of columns.

30. (Original) Apparatus according to claim 25, further comprising:
a display device for displaying the printable document to an instigator of said search; and
a printer for printing said printable document.

31. (Canceled)

32. (Currently Amended) Apparatus for formatting an electronic document intended for reproduction by printing, said apparatus comprising:

means for obtaining from a searching process location information within a computer network of at least one search result returned by said searching process;

means for using said location information to fetch and store document data from said computer network relating to each said search result, said document data including at least a portion incorporating the content and a reproducible context corresponding to searching criteria used to instigate said searching process; and

means for formatting in a print preview format at least the one select portion of the stored data including the content corresponding to said searching criteria into a printable electronic document to thereby reproduce the portion in the printable electronic document in the same manner as if presented within the entirety of the document data a context of said searching criteria found in the computer network.

33. (Currently Amended) A computer readable medium, having a program recorded thereon, where the program is configured to make a computer execute a procedure to present search results obtained from a search conducted over a computer network, said search being performed using searching criteria and returning information including network location corresponding to each search result, said program comprising:

code for storing data associated with and including at least one of said network locations;

code for extracting stored document data associated with one of said network locations;

code for examining said extracted data to identify therein said searching criteria to provide at least one specific location within said extracted data of said searching criteria;

code for using said one specific location to identify a portion of the ~~from~~ said extracted data, ~~specific data~~ including at least ~~content corresponding to~~ said searching criteria in a reproducible context with other data from the corresponding network location; and

code for formatting said portion ~~specific data~~ including the ~~content corresponding to the~~ searching criteria in the reproducible context into a printable document, to present the portion in the same manner as if presented within the entirety of the extracted data.

34. (Currently Amended) A computer readable medium according to claim 33, wherein said program further comprises code for repeating operation of said program for each remaining said network location in which said code for formatting incorporates said formatted data of said remaining network locations to said printable document, and said code for formatting incorporates the corresponding portion ~~content and context of said specific data~~ into the printable document in a print preview format.

35. (Cancelled)

36. (Currently Amended) A computer readable medium according to claim 33, wherein said formatting comprises incorporating graphical separators into said formatted printable document to separate portions of extracted data from corresponding different ones of said network locations.

37. (Currently Amended) A computer readable medium according to claim 33, wherein said code for formatting further comprises code for formatting root data, obtained from said extracted data at a root location of said corresponding network location, into said formatted printable document in association with the corresponding portion ~~said specific data~~ whereby said root data supports the context of said corresponding portion ~~specific data~~.

38. (Currently Amended) A computer readable medium according to claim 37, wherein code for formatting further comprises code for incorporating graphical separators into said formatted printable document to separate said corresponding portion ~~specific data~~ from said root data of one said network location.

39. (Original) A computer readable medium according to claim 33, wherein said printable document is formatted into a plurality of columns.

40. (Original) A computer readable medium according to claim 33, wherein said extracted data is of a plurality of data types, and said formatting converts said data types into a common data type suitable for each of electronic display and printing.

41. to 47. (Canceled)

48. (Currently Amended) A computer readable medium, having a program recorded thereon, where the program is configured to make a computer execute a procedure to format an electronic document intended for reproduction by printing, said program comprising the steps of:

code for obtaining from a searching process location information within a computer network of at least one search result returned by said searching process;

code for using said location information to fetch and store document data from said computer network relating to each said search result, said document data including at least a portion incorporating content and a reproducible context corresponding to searching criteria used to instigate said searching process; and

code for formatting the ~~stored~~ document data including at least the portion including the content corresponding to said searching criteria in the reproducible context into a printable electronic document to thereby reproduce the portion in the printable electronic document as if presented within the entirety of the document data.

49. (Previously Presented) A computer readable medium according to claim 48, wherein said code for using comprises:

sub-code for using the corresponding location information to fetch and store all document data accessible for said search result;

sub-code for checking said stored document data to identify said searching criteria therein; and

sub-code for recording, for each identification of said searching criteria, a specific location of said searching criteria within said stored document data,

each said sub-code being operable for each said search result.

50. (Previously Presented) A computer readable medium according to claim 49, wherein said code for using further comprises:

sub-code for discarding said stored document data for said search result where said searching criteria is not at least once identified therein in a reproducible context.

51. (Previously Presented) A computer readable medium according to claim 48, wherein said code for formatting comprises:

sub-code for identifying at least one portion of said stored document data associated with at least one reproducible occurrence of said search criteria;

sub-code for converting said identified one portion to a data format suitable for both electronic display and printing; and

sub-code for incorporating said converted identified one portion into said electronic document according to a predetermined format for each said search result, each said sub-code being operable for each said search result.

52. (Previously Presented) A computer readable medium according to claim 49, wherein, for each said search result, said code for formatting comprises:

sub-code for identifying at least one portion of said stored document data associated with at least one reproducible occurrence of said search criteria using said specific location;

sub-code for converting said identified one portion to a data format suitable for both electronic display and printing; and

sub-code for incorporating said converted identified one portion into said electronic document according to a predetermined format for each said search result, each said sub-code being operable for each said search result.

53. (Previously Presented) A computer readable medium according to claim 51, wherein said code for formatting further comprises:

sub-code for identifying an initial portion of said stored document data arranged at a root of said location information; and

sub-code for converting said initial portion to said predetermined format;

wherein said incorporating said converted initial portion and said converted identified one portion into said electronic document.

54. (Previously Presented) A computer network browsing application comprising code operable to perform the method of claim 1 or claim 19.

55. (Previously Presented) A document formed according to the method of claim 1 or claim 19.

56. (Original) Apparatus configured to form a printable document according to claim 55.

57. (New) A method according to claim 1, wherein the formatting of step (e) comprises adjusting a reproducible size of the portion.

58. (New) A method according to claim 1, wherein the searching criteria is formatted so that the searching criteria is distinguishable from other parts of the search results in the printable document.

59. (New) An apparatus according to claim 25, wherein the searching criteria is formatted so that the searching criteria is distinguishable from other parts of the search results in the printable document.
